

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) Apparatus for sharing data over a network having a plurality of network-connected terminals, each terminal comprising:
 - a visual display ;
 - a processor;
 - storage; and
 - memory; wherein

said memory in the terminal includes

computer program instructions to duplicate an for normal operations including

duplication of a data-containing object from a second of said network-connected terminals at a first of said network-connected terminals in response to a data requirement of said first terminal;

computer program instructions to access data in said object using locally executed object instructions at said first terminal; and

said computer program instructions ~~to maintain data~~ for normal operations also including

maintaining consistency between the data contained in duplicated objects by establishing a duplicate master data-containing object,

wherein the role of said duplicate master is switchable between said duplicated objects.

2. (Previously Amended) Apparatus according to claim 1, wherein said instructions are either stored in said storage or are loaded from an external medium and retrieved into said memory.

3. (Previously Amended) Apparatus according to claim 1, wherein said instructions to maintain data consistency between duplicated objects monitor Central Processing Unit usage and network bandwidth utilization.

4. (Currently Amended) A method of sharing data over a network having a plurality of network-connected terminals, each terminal comprising memory and a processor, said memory in the terminal including computer program instructions for managing object duplication during normal ongoing operations, including :

(a) in response to a data requirement of a first of said network terminals, duplicating ana data-containing object from a second of said network terminals at said first terminal;

(b) at said first terminal, accessing data in said object using locally executed object instructions; and

(c) maintaining ~~data~~ consistency between data contained in duplicated objects by establishing a duplicate master data-containing object, wherein the role of said duplicate master is switchable between said duplicated objects.

5. (Original) A method according to claim 4, wherein said object duplication instructions for managing object duplication constitutes a duplication manager.

6. (Previously Amended) A method according to claim 4, wherein said object from a second of said network terminals is said duplicate master.

Claim 7 – cancelled.

8. (Original) A method according to claim 4, wherein said duplicate master updates said duplicate.

9. (Original) A method according to claim 4, wherein only one duplicate master exists for a group of duplicates.

Claim 10 – cancelled.

11. (Previously Amended) A method according to claim 4, wherein said switching is the result of a command, called load-balancing, or the result of an automatic fault-recovery process performed by the duplication manager.

12. (Currently Amended) A method of sharing data over a network having a plurality of network-connected terminals, each terminal comprising memory and a processor, said memory in the terminal including computer program instructions for managing object duplication during normal ongoing operations, including :

(a) in response to an availability of a list of said network terminals, duplicating ~~an a~~ data-containing object from a second of said network terminals at said first terminal;

(b) at said first terminal, accessing data using locally executable object instructions;
and

(c) maintaining ~~data~~ consistency between data contained in duplicated objects by establishing a duplicate master data-containing object, wherein the role of said duplicate master

is switchable between said duplicated objects when a previous duplicate master becomes unavailable.

13. (Original) A method according to claim 12, wherein said object duplication instructions for managing object duplication constitute a duplication manager.

14. (Previously Amended) A method according to claim 12, wherein said object from a second of said network terminals is said duplicate master.

Claim 15 – cancelled.

16. (Original) A method according to claim 12, wherein said duplicate master updates said duplicate.

17. (Original) A method according to claim 12, wherein only one duplicate master exists for a group of duplicates.

Claim 18 – cancelled.

19. (Previously Amended) A method according to claim 12, wherein said switching is the result of a command-called load-balancing, or the result of an automatic fault-recovery process performed by the duplication manager.

20. (Currently Amended) A computer-readable medium having computer-readable instructions executable by a computer during normal ongoing operations such that, when executing said instructions, a computer will:

(a) in response to a data requirement of a first network terminal of a plurality of network terminals, duplicate ~~an~~ a data-containing object from a second of said plurality of network terminals at said first terminal;

(b) at said first terminal, access data in said object using locally executed object instructions; and

(c) maintain ~~data~~ consistency between data contained in duplicated objects by establishing a duplicate master data-containing object, wherein the role of said duplicate master is switchable between said duplicated objects when a previous duplicate master becomes unavailable.

21. (Currently Amended) A computer-readable medium having computer-readable instructions executable by a computer during normal ongoing operations such that, when executing said instructions a computer will :

(a) in response to an availability of a list of network terminals, duplicate ~~an~~ a data-containing object ~~from~~ from a second of said network terminals at a first of said terminals;

(b) at said first terminal, facilitate data access using locally executable object instructions; and

(c) maintain ~~data~~ consistency between data contained in duplicated objects by establishing a duplicate master data-containing object, wherein the role of said duplicate master is switchable between said duplicated objects when a previous duplicate master becomes unavailable.

22. (New) A method of accessing data over a network, said method comprising:

maintaining a data object as a master data object at a first station;

duplicating copies of said master data object at a plurality of slave stations;

wherein the master data object is configured to maintain consistency between the data in said duplicated objects such that the master data object is maintained and said copies are updated; and

when said first station becomes unavailable during normal ongoing operations of said network, switching the role of the master data object to one of the duplicated data objects.
